## ThreadSync — Enterprise Workflow Intelligence

Connect systems, decisions, and execution across complex enterprise environments — with governance and control built in.

### What ThreadSync does

ThreadSync is a workflow intelligence layer that unifies signals across tools (email, ITSM, CRM, ERP, internal services) into a consistent operational view — then assists teams in prioritizing, coordinating, and executing actions with defined governance boundaries.

### Outcomes (what teams get)

- **Fewer blind spots:** unified visibility across cross-system workflows
- **Faster resolution:** clearer ownership, routing, and escalation
- **Safer automation:** human verification where needed + audit-friendly logs

### How it works

1. **Connect** your systems and define workflows
2. **Observe** signals across tools in a consistent model
3. **Assist** with insights + recommended next actions
4. **Verify** with human-in-the-loop approvals and policy boundaries
5. **Execute** actions reliably with traceability

### Platform highlights

- Pre-built connectors + custom integrations
- Role-based access (RBAC) + SSO support (SAML/OIDC)
- Audit logging and governed automation boundaries
- Deployment models aligned to enterprise needs

### Security at a glance (high level)

- Encryption in transit and at rest
- Access controls, MFA, and auditability patterns
- Transparent subprocessor listing and documentation via Trust Center
